

20 Amp Electrical Requirements

Many larger copiers require a 20 amp, 120 volt dedicated electrical power outlet in order to function correctly without electrical issues. (Smaller size copiers work fine on a 15 amp, 120 volt outlet.) If you are unsure if the machine you'll be installing requires the larger outlet, please contact your sales consultant or our office at 678-289-5100 for assistance.

If your machine does require a 20 amp outlet, you'll need to have the dedicated outlet in place before the machine can be plugged in and installed. If you do not have this outlet, we recommend that the circuit and outlet be installed by a licensed electrician before the machine is delivered.

A 20 amp outlet looks like this and has a horizontal slot connected to one of the vertical slots in the outlet:

A CCS approved power surge protector is also required for your copier to be under a maintenance plan. If you purchase your machine through us, the surge is included at no extra charge and will be brought upon delivery. If you purchased your machine elsewhere, you can still purchase an approved surge from us and a maintenance plan as well.

If you have any questions please contact us and we'll be happy to help you.
